

KSR+10

Extension element for KSR inspection boxes. Height: 4"
#100202

Manual

■ Green up the roof!

Application:

With the aid of the height extension elements KSR+5 and KSR+10 (2" and 4" in height, respectively), it is easy to modify the height of the KSR-10 boxes to meet the required substrate depth.

Installation instructions:

If the roof has variable media depth, it needs to be determined how many extension rings should be installed at a certain roof outlet. It is recommended to install the extension rings together with the KSR-10 maintenance boxes. The lids need to be unlocked, and removed. Please pay attention at the lid lock cuts since the extension rings pegs should anchor into them. They help to put the different parts together to avoid that the lid and the extension rings separate from each other and the maintenance box. The extension ring has the same lid lock cuts and the base parts so the lid should be attached by the same method.

Installation Tools:

There are no special tools required for the installation of this product.
