

KSA-15

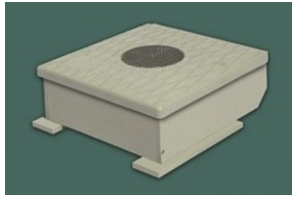

Inspection boxes for extensive and simple intensive green roofs at the parapet.

#110212

Manual

■ Green up the roof!

Application:

KSA products are especially designed inspection boxes for simple intensive and also for extensive green roofs with external down pipes located at the parapet. They ensure clear access to the drainage system.

Installation instructions:

Inspection boxes can be positioned directly above the drainage boards when they have enough capacity. Using fill up systems however, they must be positioned on the mechanical protector layer. In the latter instance drainage can be hastened by placing looped drainpipes in the immediate vicinity of the manholes. On inverted roofs the inspection boxes are placed on the thermal insulation layer and a separating layer is used to create the gravel division pocket around it. Care must be taken with the filtering layers around the manhole and it is advisable to bring up all geotextiles right to the edge of the manholes.

Installation Tools:

There are no special tools required for the installation of this product.
