

CascaDIA-80

Modular green roof system with excellent water retention capacity.
#310207

Manual

■ Green up the roof!

Application:

Trays are typically a good fit for flat or slightly sloped roofs with a smaller area, or roofs with limited access, mainly on residential buildings. Diadem offers the flexibility of selecting either preplanting their modules off-site, which offers instant green, or assembling on-site which offers more flexibility to schedule installation.

Installation instructions:

First place the CascaDIA-80 modules on a root barrier or on a protective fleece. The outer edges of the trays are interlocking, so the installation of the panels is fast and offers a stable positioning for the items. The units can be filled up by a blower, or you can use a loader, by driving on the already filled area. Depending on your needs and type of vegetation you use. The spreading of sedum cuttings, or rolling out sedum mats is also a good alternative. Young plants should be moistened regularly in the first few weeks.
