

DIAflor Sedummat Tile

Pre-vegetated sedum tile with at least 95% coverage right at delivery out of 6+ different spp.

#500109

Manual

■ Green up the roof!

Application:

Although pre-vegetated products have typically a bigger carbon footprint, than using Sedum cuttings, they are still useful in certain market segments such as clients in need of instant green. Diadem sedum tiles are pre-cut to 12" x 24" rectangles, which can easily be delivered and installed, even to hard-to-access roofs.

Installation instructions:

Sedum pads can be installed over a drainage layer and a minimum depth of 2"- 3" quality growth media. Place pads directly onto the green roof media, ensuring good contact between them and the growing media below. Take care to keep excessive vegetation from gathering under or between the pads. Staggering pads may be preferred to help increase the immediate appeal of the planting by lessening the effect of obvious straight lines. Sedum pads quickly become established on the rooftop. Within 1-3 weeks, the roots will begin to grow into the green roof media. After 4-6 weeks, the pads should be fully established into the media.

Installation Tools:

There are no special tools required for the installation of this product
